

# Grammar Implementation with Tree Adjoining Grammar: LTAG Semantics

Laura Kallmeyer, Simon Petitjean  
Heinrich-Heine-Universität Düsseldorf

Winter 2015/2016

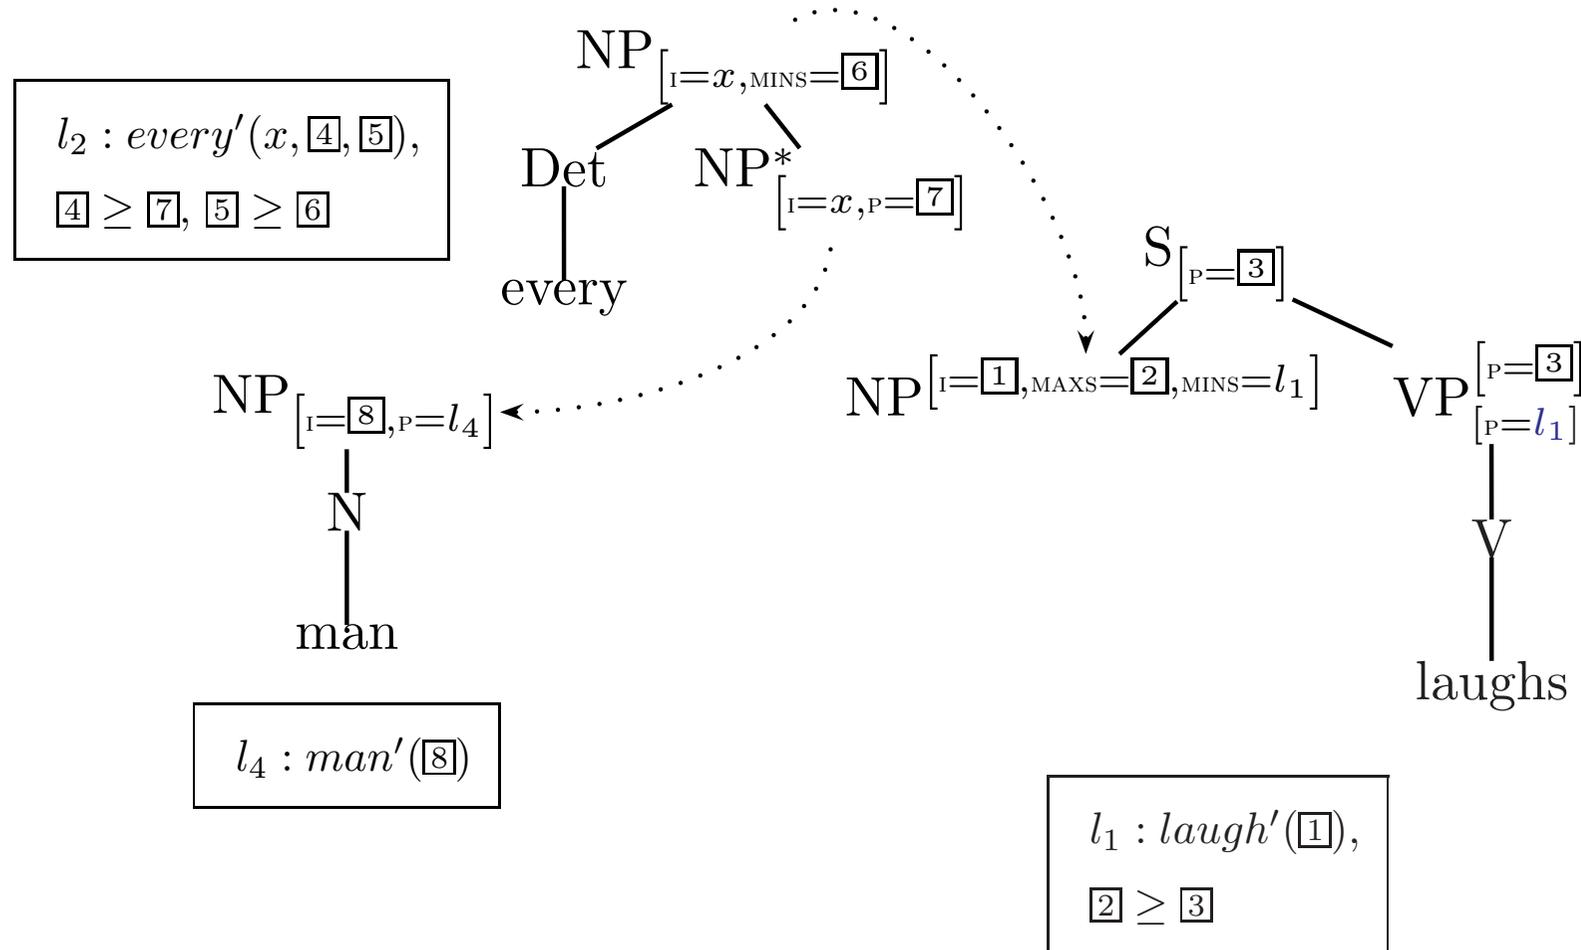

## Overview

1. Introduction
2. Bridge Verbs
3. Raising, Control, Adverbs

[Kallmeyer and Romero, 2008]

## Introduction

Reminder: quantifiers in LTAG with unification-based semantics:

## Introduction

Reminder: quantifier data

Quantificational NPs can in principle scope freely; their scope is not directly linked to their surface position.

(1) Exactly one student admires every professor

$\exists > \forall, \forall > \exists$

(2) Two policemen spy on someone from every city

$\forall > \exists > 2$  (among others)

(3) John seems to have visited everybody

*seem* >  $\forall, \forall > \textit{seem}$

Attitude verbs block the scope of embedded quantificational NPs:

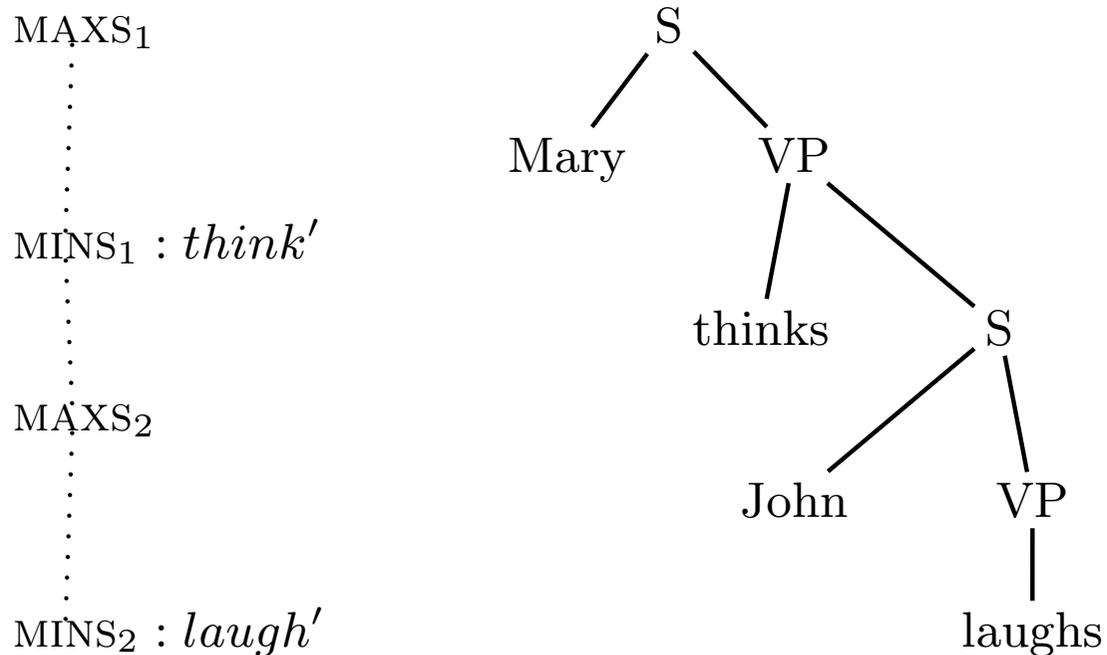

(4) Mary thinks John likes everybody

thinks > everybody, \*everybody > thinks

## Bridge verbs (1)

In LTAG, because of the extended domain of locality, it is straightforward to define some elements as blocking the embedded scope window and defining a new one for higher quantifiers:

(5) Mary thinks John laughs

**Bridge verbs (3)**

(7) Mary thinks John likes everybody

- *everybody* has to take scope within the scope window of *likes*.
- *thinks* scope over the MAXS of *likes*, and consequently also over *everybody*

⇒ only one scope order:

(8)  $think'(m, every'(x, person'(x), like'(j, x)))$

## Adverbs, Raising and Control Verbs (1)

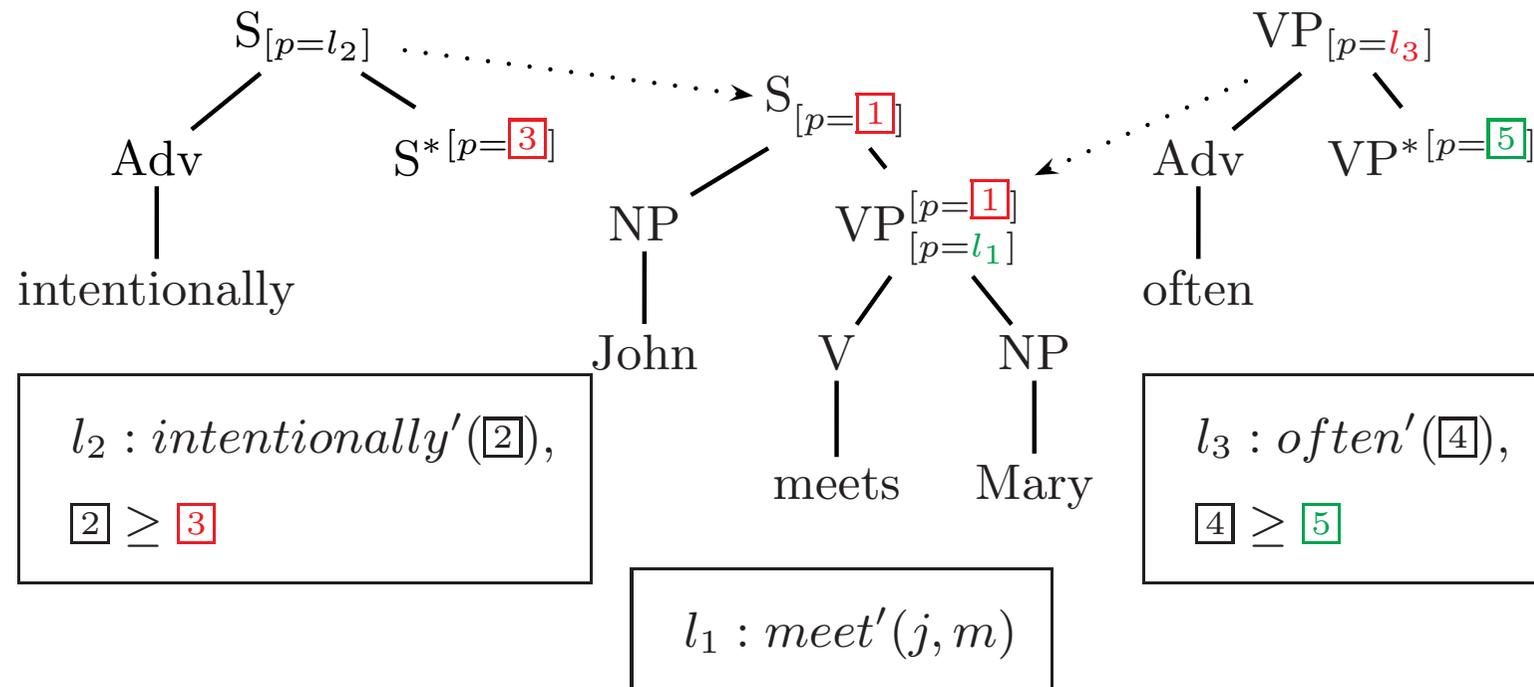

In contrast to quantificational NPs, the scope of a quantificational element attached to the verbal spine is fully determined by the surface syntax:

- (9) John seems to sometimes laugh
- a. *seem'(sometimes'(laugh'(j)))*
  - b. \* *sometimes'(seem'(j, laugh'(j)))*
- (10) John wants Mary to sometimes laugh.
- a. *want'(j, sometimes'(laugh'(m)))*
  - b. \* *sometimes'(want'(j, laugh'(m)))*

Relevant features: P features that decorate the verbal spine.

## Adverbs

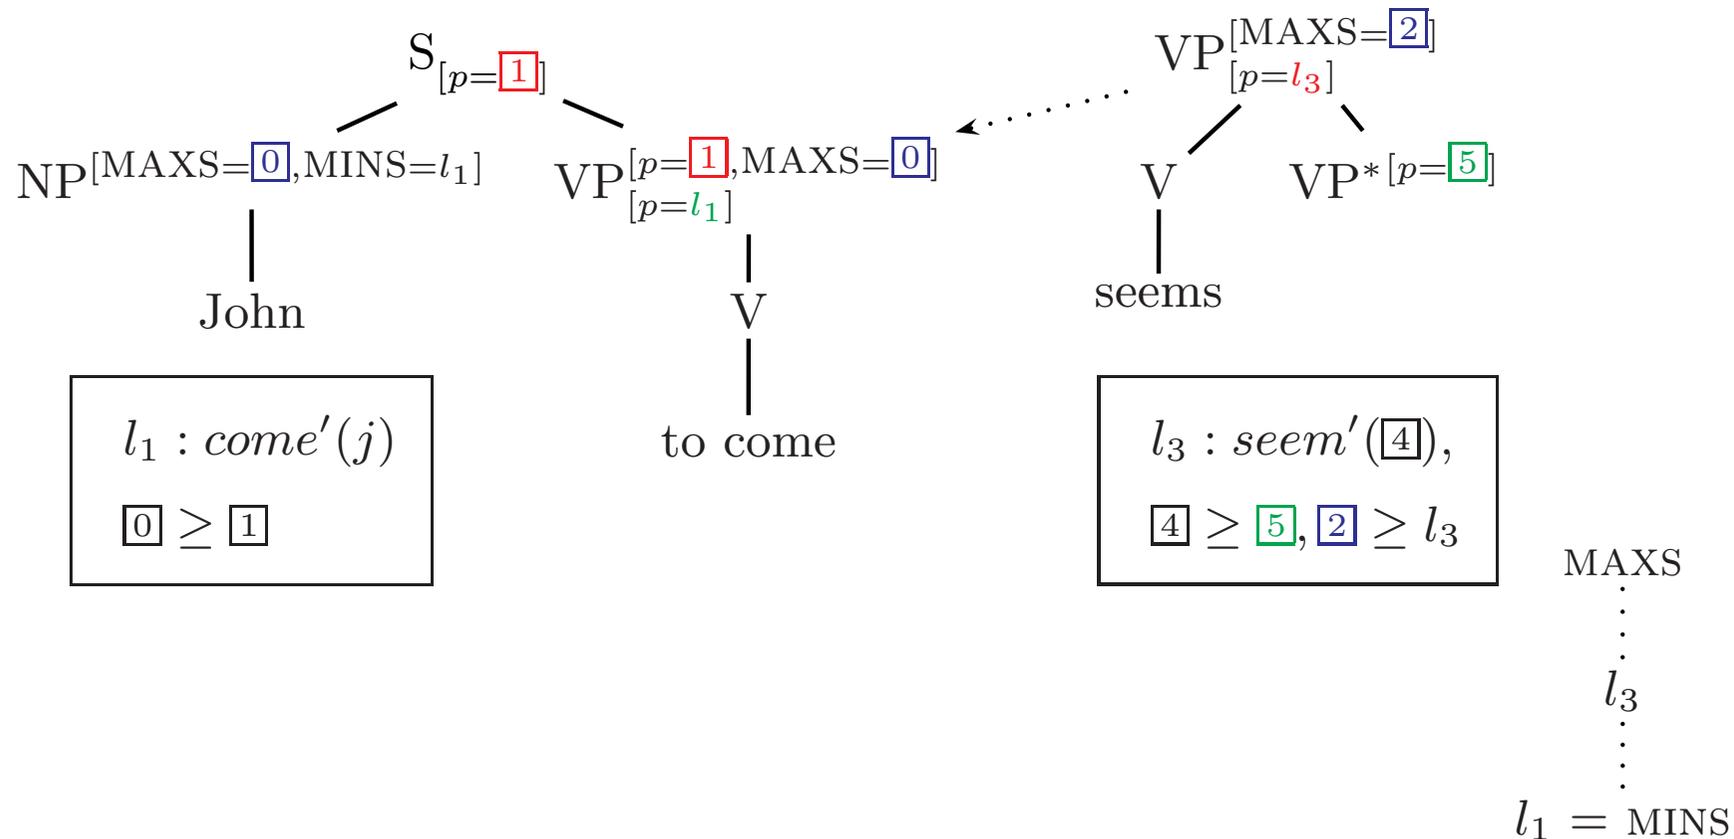

(11) Intentionally, John often meets Mary

## Raising verbs

Raising verbs are similar to adverbs:

(12) John seems to come

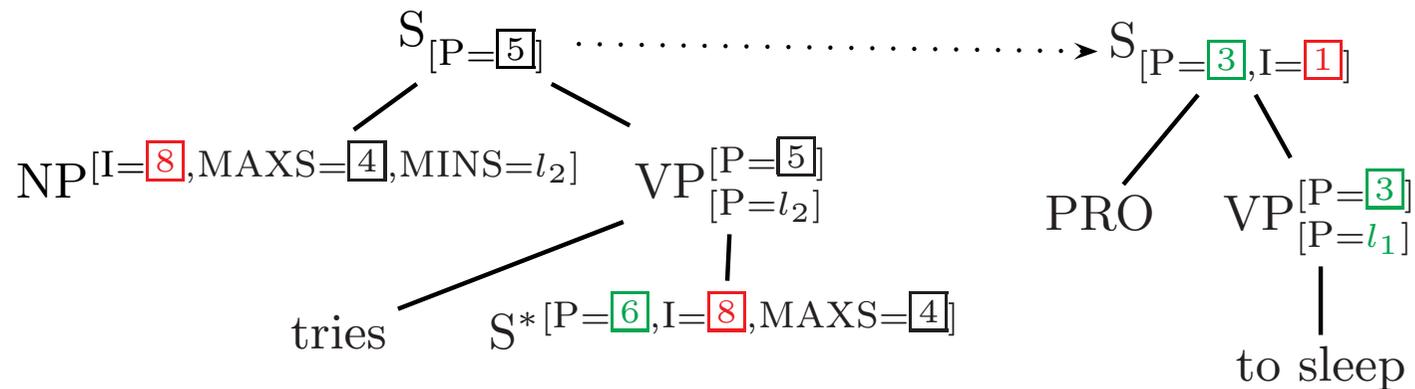

## Control verbs (1)

- Scopal behaviour as adverbs and raising verbs: embedding of lower P and providing of a new, higher P value.
- Passes its MAXS to the MAXS of the embedded infinitive (no blocking of quantifier scope).
- Provides the controller via an I feature.

## Control verbs (2)

(13) John tries to sleep

$$l_2 : try'([8], [7]), [4] \geq [5], [7] \geq [6]$$

$$l_1 : sleep'([1])$$
